The Rubber Hose That Can Take Different Forms by James Blee

Article published on January 25th 2012 | Business

You must have seen many kinds of hose here and there in your daily life. It is quite common thing used in different places for different purposes. It can be seen in the washing machine or in the garden where plants are to be watered. A hose is basically a hollow tube which can be of any length and width and it is used in carrying fluid or gas from one place to another. The requirement of the hose changes depending on the nature and temperature of the fluid. rubber hose is the most used hose as it is available in both flexible and stiff form and can be utilized for different purposes.

There are companies that produce rubber and flexible hose and in most cases these are produced using recycled rubber. There are different patterns of rubber hose available in the market. Some of the hose are covered by metal strings to give it better strength and support. Whenever you see a flexible hose it is made of thin or thick rubber as it is less reactant to different weather condition and they are cheaper too. The design that you would choose will depend on the performance required and the application. In case you require carrying hot fluid it should be coated with a layer that is not damaged in high temperature or a rubber that is resistant to heat.

There are companies that manufacture wholesale hose while some are there which sells it in the retail outlet. Flexibility depends on the material used. You can find rubber hose in machines and industrial devices too. But apart from rubber there are many more materials used in the hose but it is always better to use recyclable material in those so that the energy is not wasted.
