Article published on May 12th 2012 | Business

Stilts have been in use from time immemorial. In old Greek tragedies, we have ample evidence in the form of pictures and writings that people used stilts either for entertainment or work purposes. Those stilts were made from bamboo or wood. But the stilts nowadays are made from best quality steel, aluminum or magnesium. They are used for a variety of purposes and the drywall stilts are so called because they are used during drywall paneling and other construction work when it is difficult to reach high places.

drywall stilts come in various sizes according to their height but it can be definitely said that they are the safest of all stilts. This is because they are considerably heavier than the other stilts. The common types of stilts like the peg stilts are very good for walking, running and even jumping but it does not allow the user to stand still as he will surely fall over. Hence, he or she has to keep moving continuously. For this reason, it is greatly in demand by the people who are involved in a lot of work that involves heights. It is essential that you find firm footing as well as convenient working postures while working and drywall stilts help you to achieve just that.

drywall stilts are not extremely expensive though the good ones might cost around two or three hundred. It is also advisable that you personally try on the stilts before buying them rather than just ordering them by seeing the catalogue. This is because no two stilts are the same and the way you feel after wearing them will determine which drywall stilt is right for you. And it will also ensure safety while working.
