Article published on April 9th 2012 | Business

Automated conveyor systems are being increasingly used in different industries for the safe transportation of materials because they reduce human labor and improve efficiency. A belt conveyor system is easy to install in a warehouse and is much easier to operate than a forklift and other similar heavy machines. It can be used to move all kinds of loads irrespective of weight, size and shape.

Reduces Production Loss while Improves Productivity

Automated conveyors can be operated with the least amount of supervision during all shifts, holidays and weekends. When you use these conveyors, you save on time lost due to employee lateness and absenteeism. Moreover, the scope for human error is less and the right materials are automatically delivered to their intended areas in a smooth manner. Automated conveyor systems are best suited for high frequency shipping schedules. When you use automatic conveyors, you can minimize material and product loss due to inconsistent handling, breakage and employee inattention.

The repetitive nature of the job contributes to the tedium that workers can experience during performance of specific tasks. This can lead to human errors resulting in huge losses. If you need accuracy and repeatability, automation is your best bet to produce top quality results time and time again. Employee satisfaction is also guaranteed because of the comfort level provided by ergonomically designed automated conveyor systems that reduce the need for employees to perform physically demanding tasks.

Maximizes Space and Improves Storage Capacity

A Belt Conveyor System can be installed in different configurations so that it makes the most of the available space in the warehouse. So, you can have more space to store the products before they are ready to be shipped.

Reduces Operation Costs

Warehouses that use Conveyor Systems usually do not need to employ a large number of employees. There is a reduced need for employees because the conveyors can do the work of many employees. Businesses can cut down costs and save money on human resource management, payroll, administration costs and employee training programs. This is vital in an economic scenario that doesnâ€™t look too promising for the future.

Automated conveyors offer many advantages that significantly outweigh the installation and design costs. If you are seriously considering the installation of these programs for your warehouse to increase the productivity and efficiency, there is no better time than the present. Another month of waiting would just mean more time wasted in inefficiency.
