Using Synthetic Plastic Materials to Prevent Slip-and-Fall Accidents by Comisky

Article published on April 19th 2012 | Business

Homeowners have the responsibility of keeping the house virtually accident-free. Unfortunately, many of them set their eyes on the wrong places. Little do they know that in the house hides something so dangerous it can take the life of one or two unsuspecting souls in a matter of seconds; we know it as the floor.

According to The National Center for Injury Prevention and Control, nearly eight million people in the United States get injured in slip-and-fall accidents every year. Slip-and-fall accidents can lead to many types of injuries, ranging from minor injuries like bruises and contusions to fractures. Some cases even prove to be fatal. They occur nearly anywhere, be it on public or private property, indoors or outdoors. Most of these accidents are caused by potholes, slippery tiling, unbalanced flooring, and obstructions on the floor.

Slip-and-fall accidents never choose their victims , which is enough reason to improve your home flooring now. It is particularly true for households with children who spend a lot of time playing tag around the house. If kids were to be left unattended while playing and one of them slips, you'll be faced with a world of trouble emotionally and financially.

Preventing slip-and-fall accidents can be done by changing or improving your home's flooring. With many flooring materials available in the market, choosing the right one can feel like you're in dire straits. If you're completely new to the concept of flooring materials, consider using polyethylene sheeting products.

Polyethylene sheeting products like floor plastic are ideal flooring options because they will stick right to the tile, minimizing the chances of slips or falls. Polyethylene is a synthetic plastic, meaning it can be melted to a liquid and remolded as it reverts to a solid state. It is widely used by homeowners, particularly in kitchens, because of its excellent performance and low price. Polyethylene is available in different sizes and thickness, making it one of the most flexible materials around.

Polyethylene products like floor plastic provide unparalleled floor protection even for carpets. It is because the material has excellent impact resistance, high chemical resistance, and a very low level of friction. Basically, there's no need to worry should someone spill something on the carpet or fall on it.

Safety should always be on top of the many priorities of homeowners. Every home improvement project is an opportunity to increase the safety within your home's walls. If you want to read more on flooring products like floor plastic, ServiceMagic.co.uk provides in-depth information regarding the subject.
