Web Application Development Vs Website Development

by Sam Aaron

Article published on February 9th 2012 | Business

Web application development is a part of website but website may not be a part of web application development. Web application development is a process of developing a product which includes programs, procedures and algorithms. On the other hand website development means developing a website for World Wide Web. Web application is develop to perform a specific task accurately and efficiently and website development helps in increasing the visibility of the business. Website will usually be available on the Internet, but may be restricted to an organization's intranet. Web application will usually be restricted to the intranet owned by a particular organization, but may be available on the Internet for employees who travel beyond the reach of that intranet.

Website can never be implemented as a desktop application. It can be accessed by anybody and can contain static pages although it is possible to change the content of the web pages from a database. In this all users may have access to all pages in the web site, meaning that there may be no need for any sort of access control. It may have parts of the system which can only be accessed after passing through a log on screen. Users may be able to self-register in order to pass through the log on screen.

Web application development is the creation and maintenance of software applications to be used on the World Wide Web. Web application can be accessed by authorized users only. It contains dynamic pages which are built using data obtained from a central data store. Any authorized user may submit updates, subject to his/her authorization level, and these updates would immediately be available to all other users. No part of the system can be accessed without passing through a log on screen. Users can only be registered by a system administrator. The application may cover several aspects of an organization's business, such as sales, purchasing, inventory and shipping, in which case users will usually be restricted to their own particular area.

Web developers build, customize and extend web applications using programming languages, databases and some other things even geekier. The Web development strategies include the business of the e-commerce, the web designing, the web content development, the client and sever-side coding and also the configuration of the web server. So, when you need a website to run on a software application, you are in need of web development services and if you are looking for a software application to be run on a desktop computer, then you need web application development services. Many software development company works on both the technologies. Now a days mostly people use both the technologies for the success and growth of their business. Both these technologies and services provided related to these are different from each other.
