Why Most of Businesses Need Managed IT Services by Nikebell

Article published on July 12th 2012 | Business

The concept of Managed IT services is to practically pay attention of your IT infrastructure to help mitigate or stop IT catastrophes. Itâ€™s not only helped to prevent IT disasters but also saves your business from ongoing IT troubles by practically taking care of your network infrastructure. Generally, with the clear setup and proper strategy two-third of IT problems can go away with Managed IT services. So it is essential tools for proper businesses.

Managed IT services provides, you the tools that required to monitor and fix your IT infrastructure. These methods let you know about issues before they become costly problems. The service provider is like having your very own IT staff, but without having to pay for full time employees. The methods make an IT personâ€™s job very simple and those benefits save you finance in the long run. Managed services provide you with a gauge and the tools needed so your IT equipment doesnâ€™t run out of gas.

The price for having managed services compensates the prices of not having it. How well could your business run if you missing your data, if your server stopped or you lost all your e-mail? How could it recover from a backup immediately? Have your data backed up? Are you appropriately patched for Security updates from Microsoft or other software such as Adobe Flash or Java? Is your firewall truly able to securing your network? Do you have a preventive maintenance strategy to keep your computers running smooth? For all questions you should have an answer to, and if not, then Managed IT Services will help make certain you have the answer, resolve all those problems, and many more.

The costs of Managed Services are varying, but it often comes in a few different essences. First is a monitoring only plan. This places software on your tools to monitor your network, server and PCâ€™s, then alerts you if there are any troubles. The monthly charge for something based on per desktop and per server, and then whatever the services providersâ€™ hourly rates are for fixing issues.

The next step is a more positive approach, this includes all the monitoring devices, plus gives safety patches, such as Microsoft Updates, and Patches for other software like Flash and Java, mostly provides antivirus software and management, desktop optimization, priority service for when troubles begin, discounts on labor, and backup solutions for your data, e-mail and servers. A more proactive strategy can help solve 80% of your IT problems, which saves you money in production, IT costs, and overall workplace moral.

Except these the next stage of Managed IT Services includes everything plus labor charge. This does all the monitoring, patching, security, backups, and software management, all at a fixed monthly charge. Costs for this mostly run about $79-$130 a desktop and up to $500 per server. There are nothing additional charges for labor with this strategy, and several services providers even include hardware warranties for opted products. The plan provides you a fixed cost for your IT service requirements.
