Benefits of scaffold training by Ben Bradshaw

Article published on July 4th 2012 | Career

Constructing a scaffolding and working on it is a highly dangerous job at any workplace. Only a person trained in erecting a scaffold can ensure that the scaffolding is safe and secure. According to the Occupational Health and Safety guidelines, only a person with a WorkSafe license is eligible for constructing a scaffold more than 4 meters tall.

Benefits of scaffold training

There is a huge demand for workers trained in scaffold erection. By participating in a scaffold erection program, you become aware of the hazards of different types of scaffold systems. The scaffolding training courses help students to develop technical skills for handling diverse scaffolding projects. A trained worker can erect even the most challenging scaffolding system with utmost ease.

Features of scaffold training programs

Scaffolding training courses are usually divided into two categories â€“ constructing a scaffold less than 4 meters tall or restricted height scaffolding and erecting a scaffold more than 4 meters tall. Although according to the Occupational Health and Safety regulations it is not mandatory to obtain a license for constructing restricted height scaffolding, nonetheless, reputed construction industries and scaffolding companies prefer employees who have received a formal training in scaffold erection for the task. Scaffold training courses are conducted by experienced and trained professionals. The curriculum of the course includes identifying the important components needed for constructing a mobile scaffold tower. Besides learning the method for erecting and dismantling a mobile scaffold, participants learn the key Occupational Health and Safety norms related to constructing and dismantling a scaffold tower.

The vigorous training a person receives during the program helps to improve the planning skills. The participants in the program are taught about the importance of conducting pre-operational checks before constructing and working on a mobile scaffold tower. Pre-operational checks are necessary for preventing accidents and injuries. A trained person can promptly identify faults in the components or on the site of the construction, which they report to the senior members of their team.

Learning the safety regulations related to dismantling a scaffold tower is as important as understanding the safety norms during construction. Participants in a scaffold training course learn the necessary skills required for dismantling a mobile scaffold tower safely.

How to receive scaffold training

It is the obligation of every employer to ensure that workers involved in erecting and working on scaffolds are properly trained. Employers can contact scaffolding training organizations who can offer on site training to workers.
