Need Engineering Colleges to Become an Engineer by [Sarfraj Ahmed](#)

Article published on January 2nd 2012 | [College](#)

Employment by a government agency is not that farfetched for someone who has been through engineering college. The government does like to employ the best, don't they? So if you desire to work as an engineer with some of the best in the business, you need to find your way into an engineering college, and back out.

Many engineering colleges give their students training in drawings and designs. Of course you know how come they need this; a third of all engineering is after all designing, even before getting to the actual building part. In addition, there is not better or easier way to pass messages about spaces and dimensions than when you have it all played out in a diagram that the next engineer can read as well.

You need engineering college to become an engineer because it simply is the best kind of environment to raise young engineers. Anywhere else can slow your learning process down because you are not with people in like disciplines. And since your interests are so different, you will not get what you want or need from there.

Every form of engineering is related, and that is why the first year in engineering college is almost identical almost everywhere. That is when they teach you the basics. If you don't get it then, you'd probably never get it again. After then, they now break you up into specialties as you choose or as your grades choose for you.

Contrary to what you have thought earlier, not every single engineering college is appropriate for you. You want to understand what they offer and if their teaching methods are conducive for you. When you know that, you can apply. Trying to do so before you fully have a grasp of it would be tantamount to an exercise in futility.

Whatever type of engineering you want to do, you are bound to find colleges that offer such courses. The catch is that the college may not be in your area, but possibly halfway across the world. You want to be prepared for that, so find the engineering college right away. It's not like it's likely to take you longer than a couple of days of surfing the Internet with your specifications on hand.

If you are no good in math and science, you have no business applying to engineering college. They will have you out on your backside in a month flat. There's just no getting past engineering without those subjects bagged good. Within a semester or two, you would have flunked most of your courses because they are all based on the sciences. And then you would have to change majors or drop out or start again
