Selecting the Right HD Television for Great Movie Channels

by Nathan Brown T

Article published on March 5th 2012 | Communication

Unlike other channels, watching movie channels on High Definition TV can be very thrilling and refreshing. It will give you a theatre like experience that standard TVs can never hope to achieve. But choosing the right television can be a little hard. In fact so much information circulates around that will leave the buyer confused and confusion can lead to a bad buy. Most movie channels have plenty of graphics in them and to appreciate that you will need a HD enabled TV. The day is not far off when HD transmissions will have become industry standards.

Buying a HD enabled television is an expensive affair, especially if you want to replace all the old ones you have in your home. Having a different make and size for each room makes sense; a small one for your bed room and the largest for your living room is what usually big homes do generally. Before you put that extra money into for you entertainment needs, consider changing one at time so that should something be not comfortable, you can change your preference when you buy the next one. Here are some of the points you will need to consider before you make the investment.

The first point you need to affirm is that you are about to buy a genuine HDTV with 1280 X 720 pixels and you donâ€™t get confused with the EDTVs with a smaller number of pixels. In addition to that you must make sure that there is a HDMI connection point to support 1080p to ensure that it will support Blue-Ray and DVD players. If the set is a slim one as is the norm nowadays buy one. They are usually light enough to be hung on the wall. There are also the tube models and they can give good quality pictures but they will occupy so much of your space and moving them around is next to impossible.

Take some of the HD videos you may have with you and run a trial before you make the purchase. Watch how the colors move and how they respond to commands. The faster it is the better for you and greater will be your watching experience. Standard TV broadcasts can look blotchier than they are usually and that is because HD will actually magnify the poor quality of a standard broadcast. In fact you will be better off watching standard broadcast in a standard TV than in a HD.

How your television performs when viewed from an angle is important. You can even make a small test to see how comfortable you are with it. Stand in front of the television and move to the left or the right even as you check for the color consistency. If the changes are abrupt and get poor then it is a sign that you are likely to face a problem later. Likewise move toward the TV and back to see if the quality is the same. If the changes are too sharp then the television you are considering is not suitable for you. LCD can be generally more problems than plasma. But plasma can be a little more expensive which you need to consider.

High quality picture apart you will also need to consider the sound quality. Unless you have a matching sound effect the HD effect will not bring you great viewing experience. The general looks of the TV are important it should fit into your homes surrounding properly. Visualize how your new TV will fit into your living room and if you are in doubt take your family along with you when you make the purchase. They can even tell a couple of things that you have perhaps missed
