About easy ways to extract data from websites by Newprosoft

Article published on December 6th 2011 | Computer

Web data extraction is normally conducted by copying and pasting data from a webpage, and saving it in an easy to use format for future or immediate use. More often than not we find ourselves having to download plenty of webpage contents from numerous different websites and this means performing copy-paste operations over and over. This process is very tiring and it is also known to be detrimental to a personâ€™s productivity. The logical solution therefore is to automate the process and this is achieved with the use of web page scraping tools. These platforms guide you on how to extract data from website automatically by creating data extraction patterns and establishing crawling rules.

These tools are of invaluable help when you need to extract data from website such as names, prices, images and descriptions. Obtaining such data manually can be a very involving task that may take plenty of your office hours and productivity. With a web data extraction tool you can just create a project that entails all the above types of data and the site/s where the information is to be sourced from. From there the extraction operation is left to go on without necessitating attention from you and as such you can carry on with your other duties. The web extractor can also be used to mine data from web pages with similar structure and the information stored in more useable and accessible formats such as SQL, XML, CSV (Excel), HTML, XML, and Access, among others.

Web scraping tools are becoming better by the day and are making it easier for users to access the info they need. These developments have seen them further simplify the process of how to extract data from website and making it as simple as supplying the URL of the website to be crawled, specifying the crawling rules, and finally describing the extraction pattern.

With all these parameters set, starting web data extraction takes just one click of the mouse. Whatâ€™s more, we can have web scraping software with multithread crawling ability which gives you the ability to mine data from multiple pages within seconds of each other. Data extraction software suites are therefore the ideal solution for people who need to comfortably collect as much information as possible while avoiding manual copy-paste operations, and with a view to optimize their productivity levels.

People are also looking for web page scraper tools that can be able to extract data from website that is password-protected, and the ability to support command line options and Windows Task Scheduler so as to give extra versatility in automating the extraction process. The best web data extraction tools are regarded as those that are simple to use and thus shortening the learning curve of mastering them.
