Acer Aspire S3 and Acer Tech Support by Dawa

Article published on January 12th 2012 | Computer

Acer Aspire S3 has garnered much attention in the market, specifically from professionals. The model is geared up to challenge the MacBook-Air with its ultra slim and classy design. Powered with Intel Core i5 processors, solid-state drive (SSD) storage, and 4GB, 1,333MHz DDR3 random access memory the machine is expected to stand firm for multitasking and durable with long battery life.

Bluetooth 4.0 and IEEE 802.11b/g/n features are for hassle-free sharing of the data, files, printers and other resources. Energy Star certification keeps the product in compliance with the go green concept. The price tag 899.99 USD in contrast with the MacBook Air (starting at $1,399), and indeed, about $300 less than similar models of Asus and Lenovo is another point of attraction.

Healthy Acer Reviews available from reputed sources such as CNET, PCMag, etc., shows that the product is quite reliable in terms of design, features, performance and battery life. However, as your machine is an abode of bundle of software including Microsoft Windows, MS Office, browser, e-mail, antivirus and more, besides holding external connection with peripherals and routers as per demand, which increase the probability of software conflicts and issues. General problems related to performance and security can also baffle you a lot. Problems can be simple or complex and occasional or intermittent.

With an objective to combat all such issues, third-party remote support providers have generously added Acer Tech Support into their curriculum. The portfolio is well-organized under sub-categories as: computer setup, software installation, update and upgrade, Internet and networking, e-mail and browser support, computer security and more. Experts can remotely access your Acer system to install, activate, update, upgrade and repair system software, applications, drivers and more. They have an expertise to evaluate different components including Application log, Security log and System log under the Windows Event Viewer.

Performance of the Windows Event Viewer is the actual diagnostic platform where each and every issue can be depicted. Security related errors or warnings are often mentioned under the Action Center if your system runs on Windows 7. Understanding the root of the problem, experts follow the desired troubleshooting path.

Being an experienced user, you donâ€™t need to call Acer Tech Help-desk again and again. You may run the Performance troubleshooter to check system issues. For up-to-date troubleshooters the computer should be connected to the Internet. Access the tool as, click â€œStartâ€•, and then click â€œCo Panelâ€•. In the search box, type troubleshooter, and then click â€œTroubleshootingâ€•, under â€œSyster Securityâ€•, click â€œCheck for performance issuesâ€•.

Also, delete programs which are not in use, perform disk-defragmentation and cleanup task on regular basis. In case, your machine is flooded with error messages, or is running slower than usual or the browser homepage has gone abrupt change, or more, then probably it is infected with viruses and spyware. You can run free Microsoft Security Essentials or Windows Defender on your system to detect and remove all culprits. For driver problems explore the Device Manager, and visit Windows Update or manufacturer website to obtain desired drivers.
