Article published on March 27th 2012 | Computer

A slow computer is both annoying and ruining. A slow computer is potential of ruining your work life, personal life as well as social life. While performing an important task a slow computer really tests your patience and the annoyance gets flowed to affect the further works. Other than profusely blaming the computers get to know the causes behind this menace instead and learn the potential solution that can be implemented. Fortunately most of the causes behind a slow computer are fixable. If you personally cannot get the issues resolved go for an adept computer support that can get you through and help you regain the computer speed or better. Below are few of the major issues that need instant eviction.

1. Unclean Registry: With constant usage, the registry of a computer collects redundant entries. Such needless entries are among the major causes behind the system running at a gradually sluggish pace. One should keep the registry regularly clean and issues completely removed for the system to run without glitches. Cleaning the registry can also be done by the use of a registry cleaner.

2. Shortage of Memory: A dated system also throws tantrums and hence run slow. A memory upgrade will be the need of the hour as itâ€™s the best hardware upgrade that can be performed. Purchasing memory and then installing the same is not much of botheration rather a simple task.

3. Spyware and virus infections: Virus, Spyware and other malicious online threats are highly alarming for a system as it can mess up your data and all your personal facts and figures would be pilfered without your knowledge. It ruins the system performance and blockades its smooth pace. Download and Install an effective antivirus program on your PC to keep such nuisances at bay. For getting the software optimized for a better safety get the help of the Technicians to avail online PC support.

4. Corrupt or fragmented Hard drive: A corrupt or fragmented hard drive causes real time issues and hampers the system speed to get rid of the issue one has to run ScanDisk or similar kind of as measure to check for any physically erroneous issues with the computer hard disk drive. Further running a Defrag helps to ensure that data is synchronized and properly organized. In case you are unable to perform the necessary procedures get help from computer experts of any known online tech support providers.

5. Remnants of unused programs, files, and folders: Our systems are often loaded with unnecessary and unused programs, files, folders of data, facts and figures, pictures, music, or videos. This also unnecessarily overloads the system and hence adversely affects the speed of its performance. In such a condition deleting these contents will create more of usable disk space which will enhance the speed of your system. Once the programs are removed, the registry should also be cleaned yet again.

In case the causes are not eliminated, the PC would continue running at a sluggish gait. For optimizing the pc performance and have it back to its original form one has to keep the PC maintained from time to time. In case issues turn complex it is recommended that you avail the service of a renowned tech support provider who foster certified Microsoft support providing engineers for apt and prompt support thereby making your system run at a smoother speed without any hassles.
