Network Support for Making Computer Run Faster

by Jennifer Brown

Article published on March 17th 2012 | Computer

Nowadays it is very difficult to find a business job or educational and entertainment activity in which the computer is not used. The timely outcome of a business process or a project work depends on the computer speed. A slow computer not only hinders the progress of the job but delays it and in some extreme cases halts it completely. When the computer is used for entertainment, the slow speed causes annoyance. Sluggish computer slows down communication speed which in turn delays the business process. That is why a slow computer is considered as a bane. There are many causes due to which a computer may become slow. Some of the most common causes and the solutions are discussed below. For other uncommon and rare causes, the help from an experienced PC support provider should be taken.

Viruses, Spyware, Adware And Malware:

Viruses,Spyware,Adware and Malware are basically malicious softwares which make the computers slow. Every computer is vulnerable to these nasty softwares. Viruses are small programs which could cause lots of troubles to the computer users by corrupting stored data and making the computer malfunction. Spywares are software programs,specifically designed to gather personal information about the computer user without the user's knowledge. Personal information includes the list of websites visited by the user, the user name ,password,etc. These confidential information could put the user's accounts in jeopardy. Adwares are special programs designed by internet marketing agencies to accumulate information about the habits and preferences of the customers. The intention is to market their products more effectively. These vicious softwares make the computers run slow because the cookies and trojans take up processor time and occupy memory space. To get rid of this menace, the anti virus and anti Spyware softwares should be updated and run regularly. The proper software is not available, then it should be installed with help of a computer support provider.

Inadequate Hardware:

The operating system running on the computer might slow down the system if sufficient hardware is not available on the system. Every operating system software needs a minimum amount of RAM and hard disk memory. It must be ensured that the proper hardware is in place before running an operating system on a computer. To upgrade system resources, an experienced tech support provider should be consulted.

Insufficient Disk Space:

Sometimes if sufficient disk space is not available, the computer may become slow. The files, which are not required any more, should be deleted to free disk space. Lot of disk cleanup tools are available with network support providers. Such tools could be used to delete temporary internet files,downloaded program files,Recycle Bin files,etc. Among these files, temporary internet files occupy maximum memory space.

Hard Disk Errors:

The integrity of the files,stored on the hard disk, should be checked periodically. After prolonged use of the hard disk, bad sectors might be developed. Physically bad sectors slow down the

performance of the computer. To detect whether any bad sector is developed or not, disk error checking utility should be run regularly. This utility could be easily obtained from many PC support providers.

Large Number Of Desktop Files:

If the desktop of the computer is dotted with files, it could make the computer run slow. To improve the performance, the desktop should be kept as cleaned as possible.

Network Support For Improving The Computer Performance:

The most common causes for poor computer performance are discussed in details. The computer users could easily get rid of these problems with the help of a computer support providers. For other unknown or uncommon causes, an experienced tech support provider should be consulted.
