Article published on May 2nd 2012 | Computer

Mac has been coming up with innovative features in their electronic device segment. Now, it has introduced a new feature called as Ouch! My Mac shocked me! This is an interesting feature and letâ€™s sees what is interesting about it. So, you have bought and setup your new Mac in your home or at office. But, after installation when you touch your PC, it will give a small shock! Donâ€™t worry it just a small shock, you wonâ€™t faint or get hospitalized.

If, you are wondering why and how this is happening, then let me tell you. It is just a static electricity, which most people donâ€™t find dangerous. You might be wondering? Your PC is giving shock to you and we are telling you, itâ€™s all fine. There is nothing to worry about. Let me tell you how? Here in case of Mac PC, the little shock indicates that your PC is working all fine.

The main reason for getting shock is the static energy that your body carries. In this case our body act like a capacitor (a device that store energy). The energy which gets stored in your body generates from the clothes you are wearing, what objects you have rubbed against or been in contact with, atmospheric condition, humidity etc. When you touch touched your Mac which is connected to the earth or ground, the stored static energy get a way to get out of your body, giving you a little shock. I guess you have understand how you new Mac is giving shock to you.

There is nothing to worry about Mac shock. You will just feel little pain at the point of contact, unless your body is charged largely. If, itâ€™s the case then you might feel much more pain than, just pinch.

If, Mac shock is making you discomfort then, thereâ€™s really no way to manage static discharge or to prevent it. However, you can control the amount of shock a little bit. Humidity do help in lowering the generation of static energy in your body, so getting one in your home or at office could help you a lot in this direction. You can regularly ground your body by touching larger metal objects, which helps in discharging your bodyâ€™s static energy. Another, option is to get an ionizer, which will make atmosphere around you more conductive and reduce the charges from contact surfaces.
