PC Crash: Reason and Revival by Len Foster

Article published on February 23rd 2012 | Computer

A crashed computer will be the nightmare of anyone. People freak out when they find that their computer is unresponsive, which is natural as we keep many important files in our computer. In this digital era, where everything is digitized, computer is kind of a central unit that keeps them together and if that central unit is unresponsive; it is only natural that people will panic.

There are a number of reasons that can trigger a computer crash. Let us take a brief look at some of them.

1. Hardware Contradiction: If your PC has too many hardware attached to it and one of them is badly installed, then computer can crash. It may also happen if they are all properly installed. Somehardware may not be compatible with each other and when you try to use both of them together, PC may crash.

2. BIOS Settings: Usually BIOS should not be a problem. But, if anyone who is not familiar with BIOS tries to change settings, the PC may crash.

3. Driver Installation: The hardware requires drivers to run. If the driver is not properly installed, the computer will crash when the computer will try to use the hardware through that driver.

4. Hard Disk Drive space: The Hard disk drives must be defragmented regularly. If the hard disk gets full and it is not emptied, there is a good chance that it will crash. Also, if the hard drive has bad sectors, then PC crash may also occur.

5. Viruses: Viruses and worms are malware that can cause the crash of your computer. Those malware often does harmful operation to computer system files and it may eventually cause PC crash. Also there are viruses designed to crash PCs. If your computer is infected by any of them and actions are not promptly taken, then the PC may crash.

6. Software: Just as drivers, improperly installed software can also cause PC crash.

7. Overheating: If you overclock your processor, then the processor may get overheated and it may cause the PC to crash. Also, if the processorâ€™s cooling fan gets too much dirt, it may slow down and cause PC crash.

8. Power Supply Problem: If the hardware does not get proper power supply or the computer shuts down for power failure then the PC may crash.

There are many other reasons but these are the most common reasons to occur.

When the PC crashes, the first thing that everyone tries is to anyhow get their important data, in the fear that the PC may not get started again. But you do not need to worry about the PC because the problem that is causing the PC crash can be fixed easily. Crashed computers are not permanently crashed. It can be fixed with PowerSuite Golden 2012 by Wondershare. This software can revive your PC, help you to optimize it and it can make your PC run the way it was supposed to.

By the way, you should keep a backup of the software because after the PC crash, if you cannot access the software, it will be useless to have it.
