Safety First: Reasons to Install Security Access Control Systems by Fernando Severns

Article published on April 17th 2012 | Computer

Business theft is a recurring cause of concern for many entrepreneurs across many industries. It comes in different forms, ranging from minor cases like shoplifting to huge criminal acts like breaking into an office and stealing confidential information. Thieves strike unawares, so every business should always be on guard.

Jack L. Hayes International, one of the leading loss prevention and inventory shrinkage control consulting firms, reports that more than 530,000 people were apprehended for shoplifting and employee theft back in 2006. Estimates say that nearly $116 million could have been lost to business theft and fraud, shattering the peace of mind of experienced business owners and aspirants. Fortunately, there's one way to heighten security measures without going overboard. For excellent protection, consider installing security access control systems.

Security access control systems allow you to control individual access to inventory or other areas. Doors, turnstiles, elevators, parking gates, or other barriers can be control points where entrance can be granted or denied. These are operated by an electronic reader to determine the level of access granted to incoming traffic.

Businesses today use several types of security access control systems. There's the card reader system, which involves swiping cards with magnetic strips on the back that contain information and identification. Smart chip technology grants access by simply walking up to a door without having to swipe a card, while comprehensive software allows companies to manage security clearance, print visitor passes, and customize employee badges. In any case, access control systems ensure the safety of your business at different levels.

When choosing the right security access control systems, consider some basic principles. As security needs increase, so have the suppliers who claim to have the right system for your needs. Before testing the waters with a specific system, establish a fool-proof purchase plan. Surf the Internet for an initial list for suppliers and take time to perform background checks.

The first rule in choosing the right access controls is to identify and evaluate your company's vulnerabilities and think of the best ways to address them. Decide on the level of access control your organization needs and what you're comfortable with. Avoid security systems that are too complicated to operate which could potentially undermine your companyâ€™s efficiency.

As people always say, itâ€™s better to be safe than sorry. security access control systems can help protect your business from the dangers lurking outside. If you want learn more about access controls, visit TechTarget.com for in-depth information.
