Things That You Should Know Before Buying Custom Gaming Computers by [Fred Lannister](#)

Article published on April 4th 2012 | [Computer](#)

The one thing about gaming is that if you are serious about doing it you want to ensure that you have the equipment to support it. Gaming on a regular laptop won't provide the full experience needed, particularly if you are constantly working with a slow connection and a subpar screen. This is the reason it's smart to get one of the numerous gaming laptops that are out there.

As you could probably guess, gaming laptops are laptops that are made specifically for gaming. While this may seem a bit unnecessary at first, if you're a gamer you understand why working with a laptop that is built for a gamer is so important. A gaming laptop begins with a bigger, brighter screen which enables you to experience the games better. There is nothing greater than playing on a screen that allows you to get more out of the game that you're playing.

In addition to a bigger screen, a gaming laptop also gives you more memory, which is absolutely vital when playing video game. Having more memory allows you to load games faster without having to deal with the constant "load" screens that can plague you while playing on a desk top or notebook computer.

While having a larger screen is a big plus for those considering gaming laptops, the real draw for many gamers is the fact that it provides you with a more fluid gaming experience. One of the biggest issues that folks have when playing on desktop or regular laptop computers is that the memory is so low that it takes forever for the game to load up. This can mean that games may simply freeze while playing, which is a great way to lose to whoever you're playing on the Internet.

Needless to say, a gaming laptop is not just useful for gaming. You can still do all the other things that you can do on any other laptop, from writing papers to watching movies and browsing the Internet. While the laptop is made with gamers in mind, those buying larger screen and better memory will benefit from these laptops, even if they've never played a first-person shooter game before.

Where do you get those gaming laptops? Essentially, you've got two options: electronics stores that sell computers, or the Internet. By going to an electronics store it is possible to take a physical look at the computer prior to buying it, along with talk to an expert who can answer any questions you will probably have.

If you are looking to go the internet route, there are a number of websites that can provide you with the info that you need to ensure that you pick out the right option. Make sure that you go with a company who you can trust, along with one that can give you a return guarantee if it does not meet your standards.
