Article published on March 8th 2012 | Customer Service

From transferring the furniture of an entire home to moving a single appliance, moving is a demanding and stressful task. If you want your belongings to be transferred fast and safely, you will have to dedicate both time and effort so you are able to get properly prepared. A stress less relocation requires good organizing and great effort. Having an idea of how to achieve a smooth move will make things easier.

A fragile appliance such as a fridge may be difficult to move as there are several steps you have to do in advance in order to make sure that you wonâ€™t cause any sort of damage. You can either try it by yourself or even call a professional. In any case, reading the following will help you learn what you need to do before you move your refrigerator.

TRANSFERING A FRIDGE

Modern way of living turns to be all the more demanding. Thereby, as people get more and more busy, even the simplest task seems to be a brainteaser. Having the right advice may improve extremely helpful as it means that we will need to devote less time and save ourselves unnecessary effort.

This is what I did a few weeks ago, when I renovated my kitchen. Having a big family I needed a more spacious kitchen so I decided to turn the huge storeroom of the first floor into a new kitchen. Therefore, the transfer of my refrigerator downstairs turned to be the most difficult part of the whole task. However, after I followed some simple steps I managed to move my fridge safely. Here are some of the tips that will help you move your fridge without having problems.

MOVING TIPS FOR THE TRANSFER OF A FRIDGE

Moving a fridge may seem quite simple but if you donâ€™t do it right you may cause permanent damage. Refrigerators are not only heavy but they also have a fragile cooling mechanism that needs extra care. Therefore, the following tips will help you make the transfer of your fridge easier and safer.

First of all you have to clear out all the contents. The fridge is already heavy and having it filled with items makes it even heavier. Moreover, you donâ€™t want the contents to be damaged, so you should better pack them up, including the freezer items and even the shelves. You will also have to defrost the appliance before you transfer it, this is very important for the fragile cooling mechanism of the appliance. The defrost takes 6-8 hours, depending on the state of the appliance. You should start preparing the transfer of your fridge the day before the move, unplug the refrigerator and leave the door open to defrost. In addition, on the day of the move use some tape in order to secure the doors and wrap the cord. Provided that the doors open during the transfer, the appliance will be scratched. You should also secure the core so it doesnâ€™t get caught and turn the power source off.

Refrigerators are too heavy to carry by hand, for this task you should use special equipment. A dolly/trolley would be perfect, especially if you have to negotiate stairs. Furthermore, using ropes or even better, moving straps, the fridge will be transferred more easily, as they help keep the moving item in position. Finally, after you place the fridge on the dolly, have one person at the front and another person at the back and move around slowly working together. If you move the fridge downstairs move the dolly down slowly one step after another. Always remember to let the refrigerator sit for about 3-4 hours before you plug it in, in order to let its fluids flow back and make

the cooling mechanism function again.

However, the task may be too difficult if you donâ€™t have the helping hands or the equipment required. In this case a professional will be the best possible option. There are several moving companies that are able to help you transfer fragile appliances either to a new place or to another room in your house. They will follow these steps but they have an extra advantage as they can guarantee that nothing will go wrong.

AN EASY MOVE

Having made the right preparation I was able to move my fridge without causing problems to its function. I also managed to move my fridge downstairs easily as I had a reliable Melbourne Movers company help me. The professionals I hired made the move a breeze as they had all the equipment needed available and also a specially trained stuff.
