Article published on February 25th 2012 | Customer Service

â€˜Cloud computingâ€™ has now become a common term nowadays and has been told to be a future trend. Enterprise Mobility theory states that business and individuals would not be limited by the applications in desktops. The utilities, services and applications required for enhancing your work performance could be hosted simply in â€˜cloudâ€™ and or by some provider depending on your choice. You would require a browser and internet connection for accessing them from any place.

Basic cloud computing type

If you possess an online email account that is not installed in the desktop, then you would be surprised to note that you already are a part of Enterprise Mobility. Some of them are Hotmail, Gmail, Yahoo, MSN, etc. It is also very easy to be a part of the Cloud computing technology as you can get access to your online mail accounts from any terminal that has a browser and an internet connection.

Understanding enterprise mobility

You would be staggered to know more about Cloud computing type and its implications. If you are dependent on some software application for communication in your business, then you would be installing each of them in every desktop for your employees in the organization and that would mean you need to pay for the software or software license for each of the workstations. However, in case you use enterprise mobility for hosting applications, then you would require just one application to be hosted with the service provider and the employees could simply log on and use this service from any part of the world. This technology is also perfect for individuals who always have to be on the move and require constant access to the files or need to store them at locations where it would be easy for the other members to have a view of them.
