Article published on July 4th 2012 | Data Recovery

If there is sudden failure in the hard disk of our computer, we would be left with a confused situation and it will also have an adverse effect on our day-to-day computer activities. Even in the case of business, this sudden hard disk failure can cause financial loss as well. The best way to protect your business from such a situation is to get the help of file recovery services. These services can protect the business from data loss by recovering the files lost due to sudden hard disk failure. To prevent businesses and individuals from loss of data, there are some companies offering backup services. This service is offered in different types like online backup services, remote data backup services, etc... and here is some information about remote data backup services:

One of the fundamental differences between a remote and an online service is that the former will store files in different geographical locations in such a way that if there is some natural disaster or power failure in one area, the records in the other area can be used. Here, the files are collected, compressed and encrypted before transmitting them to the remotely located server of the service provider. On the basis of the request made by computer owners, the files are backed up either on daily, weekly, monthly or yearly basis. This is to ensure that the data stored in distant location is updated regularly.

Different service providers implement different techniques for backing up of data and irrespective of the method, the main idea is to enable the users to access the data any time. The remote data backup service is offered with a wide range of features like ability to run on computers with any operating systems like Unix, Linux, Mac and Windows, easy to manage, troubleshoot and use, reliable and quick restoration, secured off site protection to the data. Above all, with this service, users can go for continuous data backup on a daily basis from a particular folder so as to ensure that their important files are kept updated in the distant location.

Some of the service providers are offering help desk support to clarify any doubts arising to the user through their support desk and they offer 30 day trial for their service in such a way that users can go for paid version if they are completely satisfied with the backup services offered.
