Article published on February 28th 2012 | Education

Computer forensics is a functional combination of two of the most prominent fields for career: computers and forensic. But like either of the fields, the field is even more demanding and challenging. Computer forensic, for which people opt for courses like CHFI Certification, is not an ordinary computer job. It is the most crucial and thorough field where you have to compete with the criminals as they are often very sophisticated and talented.

To have a brain like computer is a saying. It is used to refer to very sharp and intelligent people. The field of computer forensic is probably the most complicated field as the professionals have to tackle the crimes that may lead to losses in billions if not attended properly. Cyber criminals are engaged serving any of the big or ambitious agencies that may be targeting any of the pricey businesses, companies, or even army of a nation. The criminals are not traceable at all if you couldnâ€™t crack the nut.

You have to devise the software to catch the infringement of cyber ethics that can be waged from any corner of the world only due to the fact that entire world is connected through the internet. And you have also to go on improving it, so you can address the new tricks that you sense or foresee the people engaged in ruining your interests may be devising.

This process is endless. And if you feel excited to welcome the challenges every time, you are the game. If you deserve it, you will have world on its feet to appraise and reward you. Monetary rewards are unlimited for computer forensics professionals as they run for excellence in a race to wipe out the talented criminals. You donâ€™t only have to pinpoint the crime (and in cases, before the results of the criminal practices start coming visible), but you have also to gather legal evidence to prove the crime.

If you feel you have the potential, you need to target high. And while targeting to attain this height, you donâ€™t have to compromise on the resources you can gather to hone your skills and get knowledge. You need to have a standard level of laboratory equipped with all the tools to detect the conspiratorial hacking efforts. That is why the concerned courses target to enable you to retrace the steps followed by the hackers, so you can also gather the evidence. The relevant courses give you ways to develop a physical chain of custody; create forensic boot diskettes; recover even lost data; convert data formats; and so on.

It is the similar context that you may have a course known as ECSA Certification that stands for EC-Council Certified Security Analyst. It mainly deals with how to assess the threat level about hacking. You have to learn how a network can be attacked, because the hackers know this and you have to contain them from doing so.
