Improving Performance with Math Games for First Graders by Jim Wheelin

Article published on January 25th 2012 | Education

In today's public school system, students at each grade level are expected to reach common academic goals at specific times. But not every child can master new skills at the same rate, which can lead to frustration and poor school performance. With math games for first graders, you can help your child tackle concepts that he or she might otherwise find confusing.

Working With a Child's Learning Style

Though the traditional classroom environment has worked well for most children over the years, there are still many who struggle with the setup. In first grade, kids are still getting used to spending the majority of the day in school, and not all of them will find it easy to adapt to learning new ideas from books, worksheets and chalkboard-based lessons. In fact, some children find it easier to learn in a more audio-visual way, especially when it comes to challenging subjects like math. In cases like this, the interactive nature of math games for first graders may wind up being an invaluable tool for laying the foundation of basic math skills.

Take the Fear Out of Learning

For many kids, fear of giving the wrong answer in front of their classmates can be crippling. This fear inhibits them from speaking up in class and asking for help when they don't understand something, putting them in danger of falling behind. Young children can learn to overcome this fear when they use math games for first graders to improve their skills. Games are positive, engaging environments that can adapt to the level of math that your child is currently comfortable with. Interacting with entertaining characters in fun settings is a far cry from having to answer a question with fifteen or twenty other kids watching. There's no embarrassment involved in getting an answer wrong in a math game; just another chance to learn the material and progress to a new skill level.

Learning Through Play

It can be easy for adults to forget that most first graders are only six years old, an age not well suited to sitting still for long periods of time. While all kids have to learn to slow down and pay attention in a school setting, it's important to give youngsters some time to learn through play as well. By including math games for first graders as part of the overall learning experience, both parents and teachers can give kids the play time they're looking for while still teaching the math concepts they'll need as they progress to higher grades. If your child has fun with these concepts rather than slogging through them with feelings and frustration and upset, he or she is much more likely to want to take on the challenge of learning new ideas as they come along.

Without a solid knowledge of how numbers relate to each other, kids will find it hard to be successful when they face more advanced math concepts. Using math games for first graders to supplement things learned in the classroom gives your youngster a fun, interactive way to learn basic skills, build new knowledge and ultimately become better and an otherwise difficult subject.
