Preference for Power Access Courses by Czeslawa Wakefield

Article published on July 10th 2012 | Education

Power access courses can be of many types depending on the industry needs. Some of the more popular power access programs fall under the building and construction industry such as Static Vertical and Boom course, PAV, harness use, scaffolding, MEWPS and ladder courses.

These are common power access training which are favored by many in the work-at-height environments. With a booming development industry, it is not surprising to have a high demand on these courses.

Accreditation

Power access programs are usually conducted by well known training sources which are recognized by the relevant industries. For example, IPAF courses are mostly power access programs which are well received by the work at height industries. Most IPAF training courses are TÃœV Certified and conform to ISO 18878:2004Â which is a highly acclaimed and recognized international standard among businesses and governments.

Only training centers that have the relevant industry accreditation and government approvals on specific courses are popular with the consumers because accredited power access courses would offer a wide job opportunity.

Power access programs need not be long as some only need a day to be conducted effectively. These coursesâ€™ qualifications are valid for 5 years to those who successfully complete them; refreshment courses or upgraded trainings are strongly recommended after that to be updated with the changes in the various industry and government requirements.

Wide selection

Some power access training courses available in the market today for various industries include MEWPs for Managers course, IPAF Operator course, IPAF Demonstrator certificate course, IPAF Loading & Unloading course, IPAF Instructor certificate and Safe Use of Ladders course.

Most of these power packed courses have their relevant accreditation and industry recognition which make them very popular. For example, a ladder may be a very simple and common tool in any home or office but its safe usage is seldom emphasized and its safety features are normally taken for granted.

The power access ladder course is just one day but it is accredited by the Ladder Associations which approves the power structure of the course where candidates can understand and apply the better concepts of ladders and steps at home or the work place.

The course contents are tailored to meet the needs of the industry while meeting the requirements of the Work at Height Legislation and Regulations. Accredited power access courses are well received by employers in their respective industries as these are recognized by major standard authorities such as British Standards Institute, ISO and Enterprise & Regulatory Reforms.
