# Scaffolding Safety Training Providers

by Wesely Gordon

Article published on May 15th 2012 | Education

It is not every training provider that can offer proper scaffolding safety training courses as the proper accreditation must be secured prior to the course offering by the service providers. An industry registered and approved scaffolding safety course must be held in the proper environment that allows learners to pick up the right skills through the right practical sessions using the right tools and resources.

Hence, scaffolding safety training courses are not assigned to every training provider in the market; these are specialized courses that must have the appropriately qualified instructors in the accredited environment.

Learning Environment

The right learning environment must be set up to support the right industry; hence, construction and tower industries require a certain environment where the height factor is an integral part of the daily operations with potential risks and dangers.

The learning environment must support the real life industry environment to allow the safety training candidates to identify and familiarize themselves with the right tools and resources to give them a competitive edge in their actual work situations.

Hence, a scaffolding safety training program that is offered by industry approved and course accredited service providers would be able to cater to the different needs of the various industry learners such as construction contractors, specialist sub-contractors, scaffolding contractors, process industry contractors, utilities and mobile access tower contractors as well as government departments who may need to be scaffolding inspectors.

These service providers on scaffolding safety training are accredited to ensure the proper training accorded to the respective industriesâ€™ workers to develop a safe and conducive environment for the public according to the property or itemâ€™s function.

The proper scaffolding equipment and resources must be made available for proper identification and utilization with the learners trained to inspect them carefully and accurately at the workplace.

Learning Content

The course candidates themselves would be taught the basic information on scaffolding, safety features, mobile tower, MEWPs, steps and ladders as well as low level platforms; these are all components related to scaffolding and construction.

Scaffolding courses are not only about the technical and basic information about scaffolding but also covers heath and safety issues which are a growing concern at the workplace. There would be some management and inspection aspects of learning in the proper level of scaffolding courses although the safety training also looks at the current and latest health and safety legislature.

Such learning content can equip one to be more than an operator of the necessary scaffolding skills and knowledge; such advanced information can propel one forward in the career path as a qualified scaffolding inspector.
