Choosing the Ideal Boat Props by James Blee

Article published on March 15th 2012 | Entertainment

Boating is one of the most engaging and best pastimes for many. There are many people who own their own boat and want it to last for a long time. But there are some major accessories of boat which is responsible for its long life. One of them is boat prop and if you can choose the boat props well it will sail according to your wish. The first and foremost rule about boat props is that you need to have a spare one every time so that you donâ€™t land into a problem in between your journey. Some people think that all the propellers are the same while there are vast differences between them. There are different things that make the difference.

Number of blades: if you search for boat props you will find that some have three blades while some have four. The pitch and diameter change with the change in the number of blades.

Size: Size of the propeller plays a major role in defining the performance of the boat. The size is measured in terms of diameter and pitch. Pitch is the forward movement of the prop and it is measured in inches. As the pitch increases the speed of the boat also increases if supported by the engine. So if you want your boat to move fast and your engine is fast enough then you can choose a prop with higher pitch.

Material: the prop can be made of aluminum, steel or composite metal. As the material changes the cost, flexibility, durability, repairing options and weight changes. For example in case of composite metal the cost is minimum but it cannot be repaired while it is easy to repair aluminum and the cost is also medium.

While making a choice in boat props, remember these things to crack a better deal.
