Videos are considered to be the most widely used multimedia contents for several purposes. Videos are widely used for spreading information and entertainment; there are multiple sources of getting these videos. You may always prefer to watch movies on the weekends and to watch music videos frequently whenever you desire to get entertained or refreshed. The videos that are from different resources can contain different contents and can be encapsulated in different formats. YouTube is the most prominent social networking website that is used for sharing and downloading videos at no cost. YouTube is a social media networking website that is a freely available platform for the video lovers across the globe. You may want to download the most famous videos of the week like adeleâ€™s â€œRolling in the Deepâ€•, or â€œWho You Areâ€• from the artist Jessie J- Domino.

These are the top ranked music videos that you love to watch on your Mac operating systemâ€™s media player, and for such purpose, you may have downloaded these videos from the YouTube. Downloading of the videos is a necessary task because this is the only solution for playing your favorite videos using your favorite media player when you are not connected to the internet. These videos are mostly in MP4 or FLV format that are container formats for the video and audio contents to pack both streams into a single file. These formats are commonly used because of the support they provide for playing videos online. If you have downloaded these videos from the YouTube, or you may have bough DVDs for watching movies in high definition format in both these cases, you can play these files directly on the media players like QuickTime media player. Your videos are not supported because of the unsupported format that cannot be recognized by the media player app. The solutions to this problem are to install a media player application dedicatedly for playing these files or to convert the videos using a video convertor tool to a supported format for your existing media player application.

Installing a dedicated media player is not an appropriate solution to the problem because you may have dozens of the unsupported video formats that cannot be played on media players. The solution of installing a multimedia app is also limited to the desktop computers. If you want to play these files on the hand held or portable devices, this solution cannot be adopted on such low performing and low storage capacity devices. The videos are necessarily required to be converted for playing on your favorite media player and portable and handheld devices.

To convert the videos to a playable format you are required to install a Mac video convertor if you are using Mac platform. A convertor tool must be capable of managing all the famous formats so that you can convert the required videos to any of the supported format. ISKYSOFT Mac video convertor is a powerful tool that can be used for such purpose. You can use this featured application to play your desired videos on your favorite media players and hand held or portable device.
