Article published on January 2nd 2012 | Fitness

These days, breast enlargement is very common among women, and particularly when we talk about high society women, then these top the list. Women may choose to have breasts enlargement due to various reasons. Some with smaller breasts wants to get the same enhanced and they therefore opt for this procedure. Other than this, there are women who have difference in the size of their two breasts, for them also breast enlargement is the only solution. This commonly used procedure can also create wonders in changing the shape of your breasts and this is the reason, why large ratio of women these days is going for it.

It has been declared by multiple research work that silicone filled gel breast implants are safe but only for use in women who are over 22 years of age. However, in order to make a wise decision one should be aware of the possible side-effects and the risk of complications involved into this treatment. Basically, breast implants are made of an outer layer of firm silicone, and it is usually filled with silicone gel or salt water.

Surgeon ensures to prior discuss the size, shape and type of implant which according to the need of patients is suitable for them. Manufacturers of breast implants guaranty that they last for at least 10 years, but they may last for longer than this, with no problems.

Women are still able to breastfeed with breast implants, and there is no evidence that silicone is found in breast milk. It's important to tell your surgeon before the procedure if you plan to breastfeed because this can affect the type of operation you have.

There are few problems which may occur during or after the operation. The possible complications include an unexpected reaction to the anesthetic usually in a vein in the leg, excessive bleeding or developing a blood clot. Other complication of breast enlargement includes breast pain, breast hardness, and numbness in the nipple may also last for a few days to a couple of months. Sometimes scars can become red, thick and painful and may need more surgery; Implants can leak. This may be a slow seeping or a sudden split. If this happens, your implant may need to be taken out. Usually serious complications are rear to see.

Recovering from breast enlargement surgery includes painkiller as advised by the surgeon. Also it is beneficial to get back to your daily activities as soon as possible. But then heavy lifting or stress exercises are to be avoided for initial three to four weeks. Sometimes, breast implants can interfere with mammography, so if you're going for breast screening it is better to tell your radiographer or nurse about your breast implants.
