Hair Transplant Surgery a Smooth Process by Julia Roger

Article published on May 14th 2012 | Fitness

People who are suffering from the problem of hair loss know how tricky it is to find an effective treatment process for hair restoration. Moreover, the fact is that the treatment process that would work for one person may not work for the other. One of the most efficient ways to stop thinning hair or reduce hair loss is to go for surgical hair replacement. Even though it does not work for all, the process has worked for many and thus it is worth considering once. If you want to know whether you can opt for this treatment or not, you should check with a doctor who does hair transplant surgery.

The surgery process is that the healthy hair follicles on the back of a patientâ€™s head are taken to relocate them on the areas where the hair is reducing. The surgery process has changed over the years. An experienced doctor would spend a lot of time to ensure that the replaced follicles are perfectly positioned to make them look normal. Moreover, the surgery would be done in a way so that you get a hairline that resembles the earlier one. Since, there has been quite a lot of progress in this field; the result can be relatively satisfying.

One needs to keep in mind that the process will not help in the growth of new hair or stop the problem of hair loss. It would just shift the follicles of healthy hair from one area to another so that those particular areas look denser with hair and less thin. Not all of the transplanted hair would grow, but some of it would grow normally. Hair transplant is a comparatively safe process if a professional and experienced doctor does it. However, the result is different for everybody and cannot be predicted.
