Working of a Turkish Coffee Maker by James Blee

Article published on February 25th 2012 | Food

A turkish coffee maker is a very interesting piece of equipment that is used to make the traditional Turkish coffee. It has a unique shape and is also available in several different types of materials. For example, you can find the Cezve, as it is known as in copper in different sizes which are capable of making 1 to 6 cups of coffee, with height varying between 2.75 inches to 3.75 inches, or a bit more on either side. Usually 1mm copper is used for these coffee makers. Moreover, the height and base is found to be generally similar..

Apart from the ratio of diameter of the base and the height, another interesting aspect of these pots is their long handle. These handles often made of brass are longer to make sure you do not burn your hands when making the pot on coal. There is a brim as well so that it is easy to pour out the coffee from the pot. There are entire sets available when you want different sizes for different occasions. There are engraved pots which have beautiful designs on them.

An interesting thing about the coffee is that finely ground powder is used so that you do not really have to filter out the coffee after brewing it. Engraved coffee pots are used with a lining of tin or shell. Wooden handles are also used so that it does not get heated up. Sometimes the thickness of the metal is about 1.5mm. Copper because of its high efficiency in boiling water is used. The cleaning of these pots is also very easy. There are some pots which come with great workmanship and could look beautiful in the kitchen cabinets adding to the dÃ©cor in a great way with their beautiful and elaborate designs.
