Helpful Ideas for Your Garden Container Ideas to Thrive by Jamie Keifer

Article published on June 6th 2012 | Gardening

Preserving plants can be delicate work, more so if you donâ€™t have enough information about how to do it. Containing them is as equally difficult as maintaining them because plants have different requirements. It is important that you know your plantsâ€™ maintenance requirements so you can properly care for them.

Potted plants are one of the homeownerâ€™s choices to decorate their houses. When placed indoors, these plants help purify the air in enclosed places. Each plant has different maintenance requirements that should be always be considered. But basic plant care includes providing plants with ample moisture, light, temperature, and humidity. There should also be proper soil mixture, enough fertilizers and regular pest control. Pots are a good way to experiment with planting and plant design and can offer versatility for new gardeners.

Gardening in pots or other containers is entirely different from gardening directly on soil. The former is easier for some because plants are cared for individually. Consider also the type of plant you choose in pot gardening. Plants are classified as perennials, annuals, biennials and bulbs.

Perennial plants are the most versatile because they grow all year round. Annual plants complete their life cycle in a single season. Hardy annuals can survive cold temperatures and are excellent space fillers in a garden with perennial plants. Biennial plants, on the other hand, are not as permanent as the perennials though they re-seed themselves so their growth cycle is comparable with annuals. Bulbs have several types that survive different seasons. They have an internal flower bud surrounded by a layer of food supply that help keep survive the changing seasons.

If you want to try gardening in a pot, there are several container garden design ideas you can try. These design ideas mix plants that have the same requirements for better growth and easier care. Perennials are usually placed together because they have the same life cycle and maintenance requirements.

Plants in a single container should also be mutually compatible with each other to reduce predation. Those that grow extensive roots should not be planted with short-rooted plants because they can damage the other plantâ€™s root systems and cause them to die. Container gardens ideas keep these from happening by suggesting plants that would thrive and benefit from each other.

Some of these garden container ideas suggest foliage assembly or mixing different kinds of plants that would grow best in a particular season. Foliage assembly in a container puts together a mix of flowering plants and garden herbs that result to a beautiful potted garden. You can read more information about potted plants from gardening.about.com and realsimple.com.
