Article published on May 28th 2012 | Gardening

So, youâ€™ve noticed that the lawn mower that you loved so much is no longer working as it should. Push, rechargeable and even small lawn mowers are powered by gas or electricity. This means that more than likely the problem lies in the motor. Luckily, this article will give you some basic lawn mower repair tips, which will help you figure out whatâ€™s wrong and how to fix the problem. Before you begin lawn mower troubleshooting, you must always protect yourself. Do this by putting on eye protective gear and gloves. Another smart move to avoid injuring yourself would be to remove the spark plug. It would be terrible if the engine decided to start on its own while youâ€™re trying to fix the problem.

Troubleshooting Your Lawn Mower

Now that youâ€™ve unplugged the spark plug, youâ€™re ready to investigate the problem with your lawn mower. Spark plugs will easily give out on you after using your mower for so long. If this happens, you simply need to purchase a new one from a mower shop and install it. If the mower begins to operate the way it should, then you know that you have solved the problem. If that doesnâ€™t take care of your mower maintenance problem, then you need to check the ignition.

You can check this by taking a piece of ground metal and touching the ignition with it. If you see a spark while doing this, then this is not the issue and you need to inspect the wire. It is not recommended that you do this yourself, but instead take it to a service center to be checked out. When there is riding mower engine trouble, it is normally the carburetor. To avoid riding lawn mower repair in the future, you must keep this clean and not allow gunk to build up on it. Use water to clean it and a wire to reach hard to get to spots. Afterwards, just let it dry on its own.

Situation Still Not Improved?

If none of the earlier lawn mower repair tips seem to work, take a look at your gas lines and fuel tanks. There may actually be a clog on the inside of one of them. To fix this problem, you only need a light brush or thin wire. Yet, there could also be a problem with your exhaust or intake valves. This is a common problem that people experience when they donâ€™t do regular oil changes. You have to replace them with new ones which still save you money in the end. It will still cost you less than buying a whole new lawn mower.

Other parts for mower that you donâ€™t have to worry about include the spark arrestor. It may catch a spark sometimes, and youâ€™ll normally find it in outdoor motors. This area of the motor should be cleaned with a wire brush regularly. If you do not do this, your motor could actually catch fire. Because a lawn mower is made up of a variety of parts, it can give out on you at any time. This is why itâ€™s imperative to perform regular maintenance on them and keep them in good shape so that you can avoid major problems for as long as possible.
