Article published on April 17th 2012 | Gardening

One of the most common pests in New Jersey is the ant and, subsequently, the ant pest control business is booming. This is good news though for people who do have some type of ant problem in their home or yard, because it means that there are a number of ant pest control companies to choose from and it is easier to find one that uses the healthier and safer alternative of natural ant control.

Ants are one insect that most people do not have trouble identifying, and their ant hill homes are easily noticeable to even small children. Ants can be quite a nuisance in a home, moving across your counter in a line, carrying away crumbs and bits of food that you have left behind. They can also cause a mess in your yard. It is not uncommon to see many ant hills in the cracks in sidewalks or driveways.

Some homeowners will try to fix an ant problem themselves by buying do-it-yourself products from the grocery or home improvement store. While these can have some success in getting rid of a few ants, they do little in the way of getting rid of the problem for good. The ant colonies go far beyond what you see on the surface, and it is only with extensive work by an ant pest control expert that the problem will truly be eradicated.

Going Natural

There are many natural ant control methods that should be tried before resorting to any kind of chemicals or poisons that can pollute the air, your lungs, and potentially even the groundwater. While ants control problems can be bad, you need to think long-term about your health and the environment around you before choosing what kind of product you want to use to get rid of the ants. Taking the extra time to find an ant pest control company that will do the job properly is worth it when you are talking about the health and well-being of your family.

While it may seem to many that ants are just an annoyance and do not cause any real problems, any ant pest control expert will tell that while they will not eat your wood like termites do, they can make nests in decaying wood without your home. They can also contaminate your food without you even knowing it by entering a cupboard for example, feasting on a loosely closed bag of food and leaving without you ever knowing they were even there. Some species of ants can even sting or bite, something that can be a much larger concern.

As summer approaches in New Jersey, it is the time to start thinking about ant control and what you want to do about the problems that you have at your home. Those ant hills that you had last summer are likely to return with a vengeance and there may even be more ants that you had last year as they have had the time to multiply. Do not hesitate to call a New Jersey ant pest control inspector and have your home examined to determine the extent of your ant problem.
