Custom Trading Computers Tailored to Your Needs by Thomasgalvin

Article published on December 15th 2011 | Hardware

As a day trader, you canâ€™t walk into a department store and purchase a computer off the shelf. These computers werenâ€™t built for the daily tasks of day traders and have cheap parts that canâ€™t handle the demands of day trading. It is important to buy custom trading computers so that allow you to perform your tasks without interruptions and delays. Regular store-bought systems are not powerful enough and are too slow. You can browse the Web for trading computers for sale that are reasonably priced and have everything you need.

The elements that you will find within custom trading computers include fast processors, high Memory RAM and multiple monitors. The graphic card and hard drive also play a part in the performance of your system. If you overlook any one of these components, you could end up with a computer that doesnâ€™t perform as well as you would like it to.

Some day traders try to use their laptops to do their daily trading tasks only to find out that they are incapable of running such programs simultaneously. Then trying to switch through the screens using a touchpad is aggravating. With a desktop customized for daily trading, you can have multiple monitors set up for maximum visual. You will be able to quickly view all of the open windows of programs and browsers. Just make sure that the graphic card that you have is high definition. One on the market today is the ATI FirePro 2460 PCIe 2.0x16. This is ideal for professional use and can provide high quality visuals on hi-def widescreen monitors up to 30 inches. But not all ATI graphic cards are great. The older model, the FirePro 2450 isnâ€™t able to produce high quality graphics. Even the quad card like the FireMV 2400 has limitations, only supporting monitors up to 21 inches.

The operating system of your trading computer is also important. Trying to run these components and programs on a Windows XP or Windows Vista isnâ€™t going to cut it. Windows 7 with 64-bits is more sufficient. Combined with enough memory RAM and processor speeds, you will have a very fast computer system suitable for your day trading.

If youâ€™re looking to set up multiple monitors, you should purchase them all at once. While looking for trading computers for sale, you should try to find one that sells the full package. Having all the same monitors will ensure that your graphic card doesnâ€™t get overworked and continues to perform optimally.

Make sure to stay up to date with your computer system and you will be able to perform your day trading without suffering time lapses.
