Inkjet Cartridge Refills- Green Products Benefit Environment Economically by [Printer Cartridge](#)

Article published on June 7th 2012 | [Hardware](#)

No matter what you buy on earth today, being environmental friendly is the most important thing to notice. This is what that has persuaded many people to think more about helping the environment and preserving our natural resources. Today, a lot of people choose to refill their empty inkjet cartridges instead of just buying new ones, thus keeping empty cartridges out of landfill.

Refilling your inkjet units not only reduces the amount of plastic and other resources used in the manufacture of the cartridges, but also save a lot of money because you don't have to shell out even more money for buying a new cartridge at higher price.

You might wonder how many times you can actually refill a cartridge! With an Original Equipment Manufacturer (OEM) cartridge from reputable companies like HP, Epson, or Brother you can easily carry out refilling for about 5 to 6 times before any problems arises.

However, some companies may claim that their cartridges can be refilled up to 10 to 14 times or till the cartridge is fully worn out. This might be basically true but if you try to refill after the 5th or 6th times, the quality of prints will fall down considerably.

When refilling the cartridge, make sure to flush out the unit to ensure that all traces of ink or dried up remnants are washed out properly. This reduces the risk of clogged printhead that result in causing irreparable damage to your printer and the printhead itself too. Many inkjet cartridge refills supplier offer cleaning kit with the package. This way if you maintain your unit then you could obtain better prints at reasonable price.

Another thing you must also consider when refilling by yourself is the mess that can be created. To take mess and hassle out of your way, you need to be very careful and follow the step by step instruction provided in the kit. It is recommended to keep a paper towel with you because when you end up with ink on your hands you will need to rub out your hands, printer and the cartridge.

Besides refilling your inkjet cartridge, you can still help the environment by purchasing remanufactured printer ink cartridges. Remanufactured printer consumables are collected, thoroughly inspected and then refilled with high quality ink. Reputable companies manufacture these cartridges adhering to the highest quality standards; so, when you purchase a remanufactured one you get similar quality and performance to that of brand new compatible supplies but typically at lower expense.
