Article published on December 16th 2011 | Hardware

When it comes to searching for a top day trader computer system, it all comes down to the components it has on the inside. Just as you shouldnâ€™t judge a book by its cover, you should never base the quality of a system based on its price tag. A lot of people dish out thousands of dollars on a trading computer that isnâ€™t efficient. Instead, you could save thousands by buying one that has great quality and performance metrics. Being a savvy shopper goes hand-in-hand with being a savvy day trader. Ensuring that your trading computer is the best quality for the best price will let you sleep easy at night, long after the dayâ€™s stock market has closed.

Ever wonder what it takes for a day trader computer system to be considered â€œhigh qualityâ€•? What components and software is needed to make your daily trading a breeze? Well, speed is an important factor, so you will need to make sure that you have plenty of it on your trading computer. For one, you will need an ultimate processor that is super fast and memory RAM that can sustain itself while running multiple programs at one time. You will also need a great deal of storage space to hold your data and security software that will protect your precious system from malware.

Having support for multiple monitors is also important, allowing you to have great visibility. Then to make your visuals high quality, you will need to have a top-of-the-line graphics card, such as the ATI Firepro 2460 PCIe 2.0x16. Avoid buying its predecessor, the FirePro 2450. This graphics card is considered to be the highest quality being manufactured today. With the multiple monitors, you will be able to see all of the programs you have running simultaneously. You can even view several browsers at once, allowing you to do quicker and broader searches on the Web. The amount of monitors you have all comes down to what you are comfortable with. This could be as many as eight monitors or only a couple. The brand and models that you should buy for your multiple monitors all depends on your own preference. Asus and Samsung are considered to be two of the highest quality brands available at affordable prices.

Remember to ensure that the configurations for your graphics cards are the same for each model monitor that you own, and make sure the video outputs are aligned. The best to have are the dual DVI output cards. Also needed are at least two cooling fans and 500 or more watts of power.
