Some people are reluctant to buy anything that is not completely brand new, as they see the alternative as second best and presume nothing else will reach the standards they demand. Whilst this may be true in some instances, it most certainly is not the case when it comes to printer cartridges. Although there are inevitably some that do not quite come up to the mark, in the main, the remanufactured inkjet cartridges are recycled by leading professionals in the industry to such a high degree that is almost impossible to tell the difference from the original.

The cartridges undertake a complete course of reprocessing which involves a thorough cleansing, refilling of ink of the highest quality and then repacking before eventually being resold. The huge and most obvious advantage of the remanufactured inkjet cartridges is the massive reduction in cost, plus it is a way of aiding the environment. Those discarded cartridges have been filling sites all around the world, so it makes sense to re-use the plastic rather than simply throw them away.

Remarkably, very often the remanufactured inkjet cartridges will actually be able to produce even better quality than the original, and in addition they will more often be filled right to the top, something that is not always the case with some manufacturers cartridges that come as part of the initial package when purchasing a printer. Many brands of remanufactured cartridges will have a money back guarantee usually of around 30 days, and as a consequence make the decision to use the recycled model an extremely easy one.

The testing of the cartridges is so in-depth done by the professional outfits that it is virtually impossible for anything to go undetected. The modern technological advances have allowed for a near perfect, error free procedure to be carried out, with total confidence in the cartridge produced at its conclusion. Every damaged or simply worn component within the cartridges are replaced, same story goes for the charge rollers, and critically, the imaging drums, which are the most expensive parts to replace - if these are anything but 100% satisfactory they will not produce the expected quality of performance. The microchips also need replacing to ensure the full functionality of the remanufactured inkjet cartridges, together with the restoration of compatibility.

The incredibly sophisticated practices that these highly talented examiners undertake are done under strict scrutiny, meaning that under no circumstances is there ever a drop in standards. The ultrasound instruments in particular will pick up even the minutest of specks and in so doing, will generate an immediate rejection. The precise measures of pressure and ink flow have to be absolutely spot on, and once again, if the slightest fault is detected, it will result in the test process recommencing.

There should be no hesitation in making professionally remanufactured inkjet cartridges part of your usual routine when it comes to replacing the toner in your printer. It makes little sense paying top prices for something that can be purchased of an identical or even better standard, in some cases, for half the price of the original.
