Article published on February 22nd 2012 | Hardware

Just as a gamer wouldnâ€™t purchase a low-end PC from Best Buy for their high performance needs, nor should a day trader. Computer gamers know that their games require a high-end graphics card, a great cooling system and a processor and RAM that can allow games to run seamlessly. For a day trader, a specialized computer is needed, using multiple monitors and many other high-end components. The best trading computers on the market come with the best of the best, so you should accept no less.

So what makes the best trading computers the top of the food chain? Well, for starters, it has everything to do with its performance. You will need to have a processor with multiple cores and threads that allow all of your trading software to run without delay. Combined with a lot of memory RAM, you will be able to run your applications without any time lapses. As a day trader, you know very well how important it is to be able to see all of your data in real time without delays.

Of course, to go along with your super computer, you will need to have multiple monitors. This will allow you to see everything at one time. Not having multiple monitors makes it difficult to see everything in real time. Clicking through multiple windows on your monitor will slow down your progress.

With a fast processor, you can have the speed that you need to allow your day trading applications to run smoothly. This should be the most up-to-date model processor available on the market. Then the graphics card that you have in your computer should offer high definition quality. Of course, you will need memory RAM that will allow multiple applications to run simultaneously.

When choosing multiple monitors for your day trading computer, make sure that they are all the same brand and model, so that there are no issues while running them all together. The top monitors on the market today happen to be made by Samsung and Asus. You can have your actual computer customized online by various distributors. Just make sure that you arenâ€™t being overcharged. There are a lot of Web sites out there today that boast about their trading computers being the best trading computers, but in actuality, they are using lower quality components. Why should you sacrifice your day trading setup with less than high quality?

Do as much research as you can about getting a great day trading computer. Keep in mind that it should be a desktop versus a laptop, because laptops arenâ€™t able to handle the capacity that you need to run your business.
