What to Look for in Computers for Stock Trading by Thomasgalvin

Article published on January 17th 2012 | Hardware

Wondering what it takes to have a great computer setup for your day trading? If youâ€™re using a factory built computer for your day trading, then you are already off the path to having a stellar system. Custom day trading computer systems are necessary for this field because they come with everything you can possibly need, including multiple monitor screens, high definition graphics cards and a super fast processor like the i7 Sandy Bridge model.

Finding a web site that customizes computers for stock trading may not be so simple at first. This is especially so because there are so many that claim to have the best components. A lot of these entities use lower-end components for their day trading computer systems and still charge thousands of dollars. Itâ€™s alright if youâ€™re not a computer whiz because you donâ€™t have to be. All need to learn about is what it takes to make your day trading easier.

You will need to search around for a web site that has computers for stock trading that has all of the components on the list that you have created. On your list should include items like an ATI FirePro 2460 OCle 2.0x16 graphics card, a double digit amount of memory RAM, at least a terabyte of hard drive space, multiple monitors made by either Samsung or Asus and stellar cooling system that will allow your computer to run without overheating.

Multiple monitors are very important for day trading computer systems. Without them, it is very hard to keep an eye on real-time data, since you have to click through multiple windows using one screen. Expand your visibility by having several computer monitors set up and make sure that they are all set with the same settings.

The amount of memory RAM that your computer system has will determine how many processes you will be able to run at one time. Then your processor will determine how fast these processes will run when opened. The two go hand-in-hand with providing you with an awesomely-working computer system. Having lots of hard drive space is also recommended, so that you can store all of the data needed without having to erase anything to free up space.

A lot of beginner day traders opt to use a laptop computer for trading because it is portable, but it isnâ€™t designed to withhold a lot of juice. Plus, the way they are built makes it hard to view multiple windows at once. Even with a hand mouse, you wonâ€™t be able to connect several monitors at once. Your computer will soon slow down after a while and it will heat up pretty quickly.
