Asbestos Poisoning Information by Bomby Dimpu

Article published on January 1st 2012 | Health

Since the previous few decades, asbestos has spread all over the location. In actual fact, if your home is over two decades old and not being extensively remodeled or repainted, the chances are it will contain asbestos to some extent. Why substances like Asbestos used in the first place and what type of damage to they do?

Asbestos is the name given to numerous naturally occurring fibrous silicate minerals that have been mined for his or her useful properties such as thermal insulation, chemical as well as thermal stability, and high tensile strength.

Asbestos was mined and used commercially in The united states beginning in the late 1800s. Its use elevated greatly during World War II. Since then, it's been used in many industries. For example, the building and construction industry has used it for strengthening cement and plastics in addition to for insulation, fireproofing, and sound absorption.

Many from the asbestos victims worked in building trades. They had been carpenters, joiners, shopfitters, plumbers, electricians, etc. They were subjected to asbestos dust in their day-to-day work with asbestos materials or because use asbestos was carried out near them.

Asbestos is really a carcinogen - that is, it causes cancer. Asbestos fibres lodge within the lungs and concentrates with repeated exposure and thus causes cancer from the lungs and stomach of people who experience prolonged subjected to the substance. The effects of lower exposures in your home are less well documented, but any exposure to the fibres can be viewed as dangerous. Asbestos is not always an immediate risk. In fact, if asbestos can be maintained in good shape, it is recommended that it be left on it's own and periodic surveillance performed to monitor its situation.

If you are at all concerned, you should think about getting the professionals in to survey the house and take samples. In addition, the manufacturer of a product might be able to tell you whether the product contains asbestos. You need to certainly not undertake extensive remodeling work on a mature house without having a professional examine the house for that presence of asbestos.

To save yourself from the possible hazards of Asbestos poisoning hire an experienced contractor if you planning any remodeling work that may damage the asbestos. Ask your local health authority or environmental office for home elevators licensed contractors.

Is there a danger of nonoccupational exposure and poisoning in the environment and products contaminated with asbestos fibers?

Asbestos is so widely used that the entire population has been exposed to some extent. Air, drinking water, and a variety of consumer products all may contain a small amount of asbestos. In addition, asbestos fibers are released into the environment from natural deposits in the earth and thus of wear and deterioration of asbestos products. Disease is unlikely to derive from a single, high-level exposure, or from a short time of exposure to lower levels of asbestos.
