First Things to Be Done Before Attempting to Repair Your Hearing Aid by [Rebecca Kavel](#)

Article published on February 11th 2012 | [Health](#)

Hearing devices has been one of the most important innovations in medicine. Hearing aids are devices used to improve the ear's sound or frequency recognition. If you have hearing impairment, let your doctor diagnose your condition so that you will be given the right aid for your ears. Unlike people who have good hearing, the hearing-impaired need these devices to communicate well with their environment.

Like hearing that can be damaged by disease or trauma, hearing aids may also be damaged and may require immediate repair. When broken, it is advisable to send them to repair shops right away before you get into trouble with your impaired ears. However, sometimes a simple malfunction that you think will cause you to replace the device can just be a simple earwax problem. There are several things that you need to do prior to calling a professional help for your damaged hearing aids.

Your ear canal naturally secretes a yellowish waxy substance to protect most of the exposed tissues of your ear from bacterial and fungal infection. This substance, called earwax, may cover your hearing aid if left not cleaned while you are wearing your device for hours. Excessive buildup of earwax can sometimes cause feedback that may mimic the effect of a damaged hearing aid. Hearing aid experts suggest that you should clean the device first before assuming that it is broken.

Sometimes, it is your own ears and not the device that is being blocked by earwax. It is slightly difficult to distinguish the difference as the effect is almost similar. When sound reception fails without any apparent evidence of damage on your hearing aid, have your ears professionally cleaned first before calling for hearing aids repair services. However, it is safer to let a professional clean your ears for you to avoid damaging the eardrums and furthering the impairment.

Moist on your hearing aid may also affect its sound reception and may make it behave like it's broken. In some models, the manufacturer requires users to dry them up to avoid this problem. Drying can be done during the night while you are asleep. Before sending for hearing aids repair, in case of real damage, the device should still be dried first.

Receding amplification can be a good indicator that your hearing aid is losing power. Most hearing aids manual recommends replacing the battery regularly to ensure excellent sound reception. Before sending for hearing aids repair, have the batteries replaced first and take note whether or not the issue remains.
