As people grow older, many health problems become more apparent. No matter how well individuals take care of their bodies, some parts do wear out, while others simply fail to regenerate as a result of the natural aging process. In other words, some health concerns may be unavoidable.

Most people fail to realize that their bodies are made up of various elements which combine to form a unified chemical, physiological, and biological whole. In other words, when one part weakens or becomes ill, other parts may be affected as well. This is the reason why today's doctors refer to a person's "total wellness" as the epitome of good health.

For example, some studies have shown that osteoporosis and tooth loss—both affecting many older men and women—may be linked. Osteoporosis is the disease which weakens bone density in any part of the body. Weakened bones are more prone to fractures. Osteoporosis reportedly affects around 10 million individuals in the U.S. today. This loss of bone density in the body may also affect the bones in the jaw which support and anchors the teeth. This degeneration, in turn, contributes to tooth loss.

The alveolar is the portion of the jaw bone that supports the teeth and its degeneration eventually loosens the teeth and leads to tooth loss. Several studies have shown that people, especially women, with osteoporosis are three times more likely to experience tooth loss than those who do not have the disease. The dentist Buckhead patients consider trustworthy can give proper advice to patients on how to treat this health concern.

Low bone density in the jaw can cause many other related problems, such as loose or ill-fitting dentures. Tooth loss actually affects around one third of adults aged 65 years and older, and the number may be higher with those suffering from osteoporosis. The dentist Buckhead patients rely on can provide the necessary remedies for tooth loss.

Meanwhile, research has shown that around 80 percent of men and women in the U.S. are suffering from periodontal disease, an infection which affects the gums and bones that support the teeth. The disease breaks down the bone and connective tissue which holds the teeth in place, eventually making them fall out. While tooth loss is a direct consequence of periodontal disease, studies have shown a strong connection between bone loss, periodontitis, and tooth loss. Thankfully, these problems can be adequately addressed by the dentist Buckhead patients recommend.
