Getting into the Details of Swimming Pool Filters by [Jonath](#)

Article published on June 28th 2012 | [Health](#)

If you have a swimming pool at home, then having swimming pool filters is extremely useful for you. It is quite common that an outdoor pool will often get gathered with small branch, leaves, dead insects, filth and mud etc. With water, deposition of algae is also quite common. The water is not cleaned from time to time. What you require is a water treatment facility and filters to make the water fully free of any pollution or dirt.

The types of swimming pool filters found in the market are diverse. For the swimming pool, there are three different types of filters that can be found in the market. You can buy any of them as all of them are almost equally efficient. People can buy different ones based on their individual requirements, the shape of their pools and filters and the budget the user wants to spare.

The first one of the swimming pool filters is the sand filter. This swimming pool filter uses a layer of sand to filter out the dirt and debris. The dirty water is passed through the chamber of sand and what comes out is clear water. Now the dirt and dust that gets accumulated within the layers of sand must be cleared from time to time. Else, the filter will not be as efficient as before.

The next in line is the cartridge filter. The mode of action of this type of filter bears resemblance with the oil filter located in the engine of a car. The cartridge is made up of variety of purifying materials stacked in layers. The dirty water is inserted through one end and the filtered water comes out of it from the other end. The third variety is the diatomaceous filter. This swimming pool filter is somewhat more efficient than the others. The tiny diatoms present inside is capable of cleaning debris as small as 5 microns in dimension.
