Godsends for the Hearing-impaired: the New Generation Hearing Aids by Rebecca Kavel

Article published on May 14th 2012 | Health

Hearing impairment can impact people of all ages. Even though previously related with the senior, it can affect younger people as most of them are continually listening to loud music. There are also people suffering from hearing impairment because of a childhood disease, or because their mothers became ill while pregnant. In any case, there are hearing aids that can help these people communicate better and delight in music and motion pictures much like everyone else.

Hearing aids magnify sounds and channel them securely into the ears. Nevertheless, these cannot treat hearing impairment. Hearing aids can be readjusted according to the user's sound standards. There are several types that can suit a user's condition, but it is better if items are purchased depending on the suggestions of a physician.

Behind-the-ear or BTE aids are the most frequent and most recognizable type of hearing aid. These have an earmold that the individual wears over the ear. BTE aids may have a big or small noticeable receiver that can be fitted in the ear canal. Individuals who do not wish to use conspicuous hearing aids choose this "receiver in the canal" (RIC) aid.

There are also in-the-ear (ITE) aids which can be seen by a person talking face-to-face with the user. These are made of silicone and are comfortable to don in the concha, the "ear bowl," just outside the canal. There are also variants called completely-in-canal, or CIC aids, that are hardly noticeable externally. CIC aids are great for diminishing feedback and static.

Developers of hearing aids understand that while hearing aids can enhance communication, there is barely any type of help for users in speaking to people via the telephone or tuning in to the radio or television. This is why Bluetooth tools have been created to connect calls with the hearing aid. When searching for a wireless hearing aid for sale, it is valuable to look for Bluetooth devices, too. Many telephone companies have even developed gadgets suitable for hearing aids.

For instance, some wired hearing aids for sale are suitable with Telecoil or T-coil gadgets. These can be directly connected with hearing aid compatible telephones and mobile phones to allow the user hear more clearly.

The same can be done with television sets. Stores of hearing aids online also supply "TV ears" that can be connected to the television, which then transmits sounds to the hearing aid by means of a telecoil device. These can also be utilized with the radio. For more details, see TIAOnline.org/policy/accessibility/tia-and-hearing-aid-compatibility.
