Hearing and Hearing Aids: Things You Need to Know by Rebecca Kavel

Article published on May 14th 2012 | Health

Hearing plays a considerable role in daily life. The sounds of nature, the music that serves as meals for the soul, the caring words of loved ones, and the noise of an incoming vehicleâ€”all these are meaningless to one who cannot hear. Given these facts, one can state hearing makes communication feasible.

Sadly, hearing can decline overtime. Contrary to what many believe, loss of hearing can occur as early as mid-20's. In fact, senior citizens make up only one-third of the US population with hearing loss. The deaf and hard-of-hearing compose the biggest group of handicapped people in the US, totaling to close to 28 million.

Hearing loss in grownups is commonly caused by noise pollution, earwax, age, ear infection, and medical conditions like stroke, high blood pressure, and diabetic issues. According to the Center for Hearing and Communication, sound is the biggest contributor to hearing loss as paying attention to an MP3 player at high volumes or merely a day-to-day 15-minute exposure to a noisy subway can induce permanent ear damage. If you think your sense of hearing has depreciated the past couple of years, you may wish to think of going through hearing exams.

Hearing tests can identify the kind of hearing loss you have by determining your potential to hear sounds that get to the inner ear through the ear canal, and the noises transferred through the head. Most hearing exams will definitely require you to reply to series of tones or words, but there are others who don't call for one. If you are detected as prone to hearing difficulties, specialists may recommend the utilization of hearing aids.

A hearing aid is an electronic gadget that makes tuning in simpler for people who have hearing problems. It includes three parts: a microphone, an amplifier, and a receiver. The mic is for picking up sounds in an acoustic surrounding and turning them into digital signals; the amplifier selectively magnifies these signals; and the receiver changes the electronic signals back to noises when they are delivered to the ear.

Hearing aids are available in different styles. Some of them are in-the-ear aids, behind-the-ear aids, receiver-in-canal aids, extended wear hearing aids, and a lot more. There are also many hearing aid brands, and each of them differs in cost and quality.

Sense of hearing is a very important part of being human. However, that does not indicate that you should not do anything about it. If you are detected to be at risk of hearing loss, it is advisable to have hearing aid services immediately. To read more on hearing aids, log on to CHCHearing.org.
