Article published on June 25th 2012 | Health

There aren't too many products offered on the market today that have taken a 500 year old industry and turned it on its ear. I guess the introduction of the automobile into the transportation market comes close. Horses have been used by humankind for thousands of years...and then come the automobile. The bow and arrow is another product that was vastly affected when the musket was invented. Fast forward to 2003 and you will see another important landmark entered; the introduction of the Electronic Cigarette into a 500 year old, $600 billion market.

I really don't need to explain to anyone how a cigarette works, but for the purpose of this article, I will point out that tobacco, rolled in paper or stuffed into a pipe, delivers nicotine to the user when it is burned and inhaled. Simple enough, if you want to ignore the over 5000 harmful chemicals which are delivered to the smoker along with the 50 or more carcinogens included into that number. Alternatively, the inLife Electronic Cigarette (E-cig) is comprised of a rechargeable battery, an atomizer and cartridge combination that contains varying amounts of nicotine. In Life offers maximum, high, medium, low or zero nicotine cartridges. The cartridge contains propylene glycol and glycerol (both commonly used food additives) water, flavor and nicotine in a desired level.

When the user inhales at the mouthpiece, a small switch located in the battery is activated and power is delivered to the atomizer. The action is regulated by a microchip which is also located in the battery. When power from the battery is applied, the atomizer is activated and creates a vapor derived from the moisture and propylene glycol and glycerol that are found in the cartridge. As the vapor passes through the cartridge, it picks up the nicotine and flavoring and delivers it to the user. The user absorbs the nicotine either through the mucus membranes in the mouth or through the lungs and then exhales. Users of the inLife Electronic Cigarette (E-Cig) report that the product comes incredibly close to the sensation of smoking a real cigarette. The flavor is spot on and the nicotine delivered completely satisfies. The product also satisfies the much desired hand to mouth motion tied so closely to the smoking of a real cigarette along with the accurate feeling one experiences when inhaling burning smoke.

The Electronic Cigarette uses state of the art technology and represents a logical alternative to traditional tobacco smoking products.
