Cancer results due to uncontrolled cell growth. It is general term that is used to describe different types of diseases. Human body is made of various cells and they all work together to make other parts functional. When a person is affected by cancer of those cells stop working and showing normal signs so eventually those cells die within a period of time. But still then cancerous cells share same types of properties and needs as that of normal cells.

A normal cell behaves abnormally once affected by this deadly disease. Remember every case of cancer is different and unique. They have own set of generic and unique changes. Some might grow fast while others might take years. Actually there are different types of cancers that often lead to complicated treatment. Despite of different types of features they do have some common properties. Therefore it is important to understand the basic, shared and other features of cancer.

Statistics of Cancer Suffering Patients

According to cancer treatment centers, the most common type of cancer is prostate cancer. In US alone there are more than 240,000 new cases. Pancreatic cancer has been reported as lowest incidence as per the current year. Whenever a person is affected with cancer he or she actually shows no symptoms so they should limit the risk factors involved in it and undergo proper screening. This is specific to certain age so the primary diagnosis depends on the patient's age.

What are the Common Symptoms of Cancer?

Usually people who smoke, get exposed to sun and consume heavy alcohol are prone to get this disease. They should be aware of possible cancer symptoms and must go for check up on regular basis. People should know which conditions can lead to this deadly disease. They should not ignore any warning symptoms to get a possible cure. Most of the symptom or complaint is usually harmless therefore if you find any of these like

Simple infections like bronchitis or sinusitis, persistent blood tinged saliva. These can be symptoms of lung cancer, neck or head. Anyone who suffers from cough for more than a month with mucus and blood should see a doctor. Other things that you should keep in mind should be change in bowel habits that is related to fluid intake or your diet. Sometimes the person can also suffer from continuous diarrhoea.

The signs and symptom might not be enough to find out what is causing this disease? As cancer grows in your body it begins to spread to nearby areas, blood vessels and nerves. If the cancer is critical like brain tumour then if smallest tumour can be dangerous for your body. But sometimes cancer starts in a place where it shows no symptoms. The signs and symbols actually depend on how big is the cancer?

Common Cancer Side Effects

Let us understand if lung cancer treatment has some side effects or not. Some effects can be bad but others can be fairly mild. Some patients complain that they have a tough time taking all these treatments while for some others work well. For example while taking chemotherapy the usual side effects include vomiting and nausea, hair loss, mouth sores and hair loss. This cancer treatment can also damage blood producing cells in the bone marrow which lead to low blood count. The reputed cancer treatment centres suggest which will work better for patients.
