Article published on April 26th 2012 | Health

If you are suffering from dental health problems like having crooked teeth or a misaligned bite, there are various kinds of treatments that can help in strengthen your teeth including braces and many other. In this scenario, you should ask your dentist about the solution that could refer you to an orthodontist. Orthodontics is the foremost spatiality of dentistry which is concerned with the study and treatments of improper bites (referred to as malocclusions) that may be result of disproportionate jaw relationships or tooth irregularity. The professional medical experts who give the treatments are known as Orthodontists. This treatment can deal with the modifications and control of facial growth. Thus, this kind of treatment can focus on dental displacement only.

Nowadays, orthodontic treatments have become technically advanced. The use of digital models in orthodontics is rapidly increasing as the industry undergoes analog to digital conversion in record keeping. Now, the more advance model i.e. Three Dimensional Dental Models for Computer Automated Treatment Simulation has been developed that are used to reduce the amount of human input needed for orthodontic treatment planning. With help of this software tool, teeth as well as gums can be segmented from each other automatically. Moreover, this software provides cost-effective and efficient method for completing the segmentation process.

As far as comprehensive orthodontic treatments are concerned, various kinds of metal wires and orthodontic braces are used. There are various kinds of braces which are widely used for the treatment.

â€¢ Lingual-type brackets: These brackets are usually attached to the back of teeth, hiding the bracket from view.

â€¢ Brackets: These are made of plastic, stainless steel or clear or tooth colored ceramic that are bonded to the front of each tooth. Plastic and ceramic brackets are generally used for cosmetic perspectives. There is a disadvantage of plastic brackets that it may become stained and discolored by the end of treatment.

â€¢ Traditional bands: These kinds of braces are not is use and have been outdated. It consists of the use of metal brackets soldered to metal bands that are wrapped around each tooth.

There are some newer â€œmini bracesâ€• available in these days which are much smaller than traditional braces, may be option for some. Before choosing any particular braces, you must consult to your orthodontist who can suggest the best braces for you after performing various dental checkups and tests. They will choose one of the best braces that are best suited for your specific needs and requirements.
