Oral Health Problems Common in the Childhood Stage by [Jane Tinkle](#)

Article published on May 15th 2012 | [Health](#)

Oral health care is important for everybody, regardless of age. However, people of different ages have varying dental conditions, as well as mental and emotional states. Fortunately, there are reliable dentists out there that can take care of patients of all ages, from babies to adults.

If you are a parent, surely you realize how important oral health care is for your kids. It is better that your kids learn proper dental hygiene at this time in their lives. You should take your kids to reliable family or pediatric dentists for assistance in oral health care. If you live in Brampton, Ontario, then fret not; there are numerous trusted family dentists all over your area.

Perhaps you are worried about what possible oral health problems could affect your children, especially when they are still very young. Listed here are some of these problems. With this, you can have a better idea of how to deal with your children's oral health care.

Baby Bottle Tooth Decay. Also referred to as nursing bottle syndrome or nursing caries, this condition can occur when your baby's teeth are usually in contact with sugar-rich liquids, like milk, fruit juices, and others; even human breast milk can cause caries. The sugar in these substances is converted by bacteria into acid, which breaks down the tooth structure. Caries can cause pain and discomfort, so immediately take your baby to the dentist. If your baby's teeth are damaged, this could affect the permanent teeth that will soon grow in his mouth.

Thumb Sucking. Thumb sucking is a rather common habit among children. However, when your child is starting to grow permanent teeth, it is advisable to try and stop your child from continuing this habit. Thumb sucking can disrupt the alignment of the teeth, which can lead to other inconveniences. Examples of these include difficulty in chewing or pronouncing some words. Going to a dental clinic Brampton parents trust can help you deal with this problem.

Early Tooth Loss. Your child can prematurely lose some of his teeth due to various reasons, such as injury or decay. If some teeth fall out before the permanent teeth start growing, the remaining teeth can slowly move into the empty space; this poses a problem when the permanent teeth do start growing. Taking your child to a trusted dental clinic in Brampton can help remedy this dilemma.

To be safe, regular visits to your dental clinic Brampton can help protect your child's oral health. If you want to know more about dental problems that your child may experience, you can go to webmd.com/oral-health/oral-health-problems-children for more information.
