Article published on May 31st 2012 | Health

Today we have different health care practices and medicines essentially give the art of healing. To maintain and restore health, we use different curative and palliative medicines. Medical technology is used to diagnose and treat various diseases that affect human body. It includes medical devices which are intended for the use in diagnosis, treatment, cure and prevention of the diseases. Less invasive treatment options and recent advances in medical technology offer cost effective treatment today.

Center for Interventional Medicine in Washington DC provide minimally invasive treatment and special care for their outpatients. Their main advantage includes the less risk during treatment and very short recovery time. Also there is no need of large incisions and general anesthesia procedures for this treatment method. They have the famous interventional radiologist, Dr. Antony who is experienced in treating varicose veins and venous reflex disease. They have special treatment procedures on peripheral arterial diseases, women's health, pain management, vascular access for oncology and dialysis access.

IVC filter is a medical device which is implanted by the interventional radiologists or vascular surgeons in Waldorf MD. These filters are implanted into the inferior vena cava to prevent pulmonary embolism. Such filters are inserted by the blood vessels. Pulmonary embolism is the blockage of main artery of the lung or one of its branches by a substance that is travelled from elsewhere in the body through the bloodstream. The obstruction of the blood flow through the lungs and the resultant pressure on the right ventricle of the heart lead to the signs of pulmonary embolism. There are different situations where the filter is placed above the renal veins. IVC filters are placed mainly for the failure of anticoagulation, large clots in the vena cava or iliac veins and patients at high risk of having pulmonary emboli. An anti coagulant is a substance that prevents coagulation or clotting of blood. Most of the filters are permanent and today we use removable filters also. Retrievable filters are fitted with a device that allows them to be pulled back into a catheter and removed from the body.

Paracentesis procedure in the hospital of Waldorf MD is involving the needle drainage of fluid from a body cavity, which is an anti fluid-filled space in a multicultural organism. The human body cavity is normally refers to the ventral body cavity. Paracentesis is used to relieve the abdominal pressure from ascites which is meant by the accumulation of fluid in the peritoneal cavity. It helps to diagnose spontaneous bacterial peritonitis and other infection that occurs in peoples with portal hypertension and nephrotic syndrome. It also helps to find metastatic cancer and blood content in peritoneal space in trauma.

We have lots of initiatives to improve the health and lifestyle. Find the permanent relief from haunting diseases by such services.
