## What is Root Canal Treatment?

Root Canal Treatment is basically a surgical procedure in which the tissues next to the affected teeth are elevated and access to the root is gained in order to treat the disease. The process is an easy one as performed in a dental clinic and generally requires local anesthesia. After gaining access of the infected area, the dentist removes the affected tissue. A filling is used in order to seal the balance area. In a few cases where the damage is too much, the treatment might not be really effective and the only solution would be the removal of tooth. An Endodontist carries out the procedure.  An Endodontist is a dentist who is an expert in treating the diseases related to the inner part of teeth.

## Goal of the Treatment

The only goal of the Root Canal Treatment is to prevent the extraction of the tooth and giving it a healthy life for years to come. Only the diseased portion of the tissue is removed.
